                                                                                                                                                   Proposition of proliferation or survival of, esp. malignant erbB2, procells - by introducing nucleic acid mol. encoding antibody homologue procells - by introducing nucleic acid mol. encoding antibody homologue procells - by introducing nucleic acid mol. encoding antibody homologue procells - by introducing nucleic acid moles are sequence erbB2, protein intracellularly processed and binds, pref. erbB2, protein intracellularly processed and sequence encoding a signal peptide CC (R94019) linked to a second sequence (T17728) encoding a single CC (R94019) linked to a second sequence (T17728) encoding a single CC (R94019) linked to a second sequence (T17728) encoding a single CC (R94019) linked to a second sequence (T17728) encoding a single CC (R94019) linked to a second sequence (T17728) encoding a single CC (R94019) linked to a second sequence (T17728) encoding a single CC plasmid as template. The signal peptide directs the scFv to the CC plasmid or viral vector to facilitate expression of the scFv antibody composition of the homologue inhibits surface expression of erbB2 and CC thereby inhibits cell proliferation and cell survival and decreases

The source of human erbb-2 protein for the prodn. of antibodies not provided the source of human erbb-2 protein for the prodn. of antibodies not provided to express the human erbb-2 protein on its surface (N/erbb-2). Abs no. 21 and 23 are directed against the extracellular domain of gp185 erbb-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. animals given a combination of the 2 Abs, tumours completely regressed after 11 days.

Example 2; Fig 2A; 102pp; English.
A cDNA clone (T34542) codes for the heavy chain variable region
(R99687) of monoclonal anti-idiotype antibody 3H1 (ATCC HB 12003
It was obtd. by PCR amplification (see also T34543-44) of cDNA
derived from 3H1 hybridoma cells. Anti-idiotype antibody 3H1
elicits a specific immune response to a unique epitope of
carcinoembryonic antigen (CEA) that is not present on other
members of the CEA family or on normal adult tissues. 3H1
can be used as a vaccine to elicit immune responses in pattents
with advanced CEA-associated disease or, when labeled, to enhance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LT 4

CA CDNA clone (T31541) codes for the heavy chain variable region (CVH) (R98411) of 3H1, a murine monoclonal anti-idiotype antibody (CVH) (R98411) of 3H1, a murine monoclonal anti-idiotype antibody (CVH) (R98411) of 3H1, a murine monoclonal anti-idiotype antibody (CVH) (R98411) of 3H1, a murine monoclonal anti-idiotype antibody (CVH) (R98411) of 3H1, a murine monoclonal anti-idiotype antibody (CVH) (R98411) of 3H1, a murine monoclonal anti-idiotype antibody (CVH) (R98411) of carcinoembryonic antigen (CEA) and which elicits an immune response in patients with advanced CEA-associated disease, e.g. colorectal cancer. It was obtd. by PCR amplification of 3H1 hybridoma DNA (See also T31545-46). The isolated polynucleotide, and/or a polynucleotide (see also T31540) coding for the VL region (R98410) of 3H1 can be used to design probes and primers, in expression Systems, and in pharmaceutical applns, including vaccines, gene therapy and genetic immunisation, partic. against cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

PS Disclosure; Page 39; 66pp; English.

CThis cDNA sequence includes a coding region for the heavy chain variable region (VH) (see W26729) of murine monoclonal anti-idiotype antibody 3H1. A cDNA sequence (see T99434) for the VL region (see W26728) is also provided. These clones can be utilised in the recombinant production of 3H1 polypeptides. 3H1 induces a specific immune response against a distinct and specific epitope of carcinoembryonic antigen (CEA), a tumour-associated antigen. The invention provides methods of delaying development of CEA-associated invention provides methods of delaying development of tumours, including colorectal, gastric and pancreatic tumours, as well as other adenocarcinomas such as those of the breast and lung, and collising cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Table 6; Page 57; 151pp; English.

Table 6; Page 57; 151pp; English.

The sequences given in Q43842-43 encode the light and heavy chains, respectively, of the chimeric antibody 128.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothellal cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent neurological disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzheimers disease. It may also be used for diagnostic methods.

Control Sequences given in Q43846-48 represent the expression vectors paH4625, paH4807 and paH4808. These vectors represent the cloning of the different human gamma isotypes, gamma-2, gamma-3 and gamma-4 crespectively, with the variable region of the murine monoclonal contibody 128.1. These plasmids each encode a chimeric monoclonal contibody in which the heavy chain (VH) is derived from a murine source and the sequences encoding CHI, CH2 and CH3 are derived from a control

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                QY
The sequences given in 04386.48 represent the expression vectors cpAH4625, pAH4807 and pAH4808. These vectors represent the cloning cof the different human gamma isotypes, gamma-2, gamma-3 and gamma-4 respectively, with the variable region of the murine monoclonal antibody 128.1. These plasmids each encode a chimeric monoclonal cantibody in which the heavy chain (VH) is derived from a murine course and the sequences encoding CH1, CH2 and CH3 are derived from a human source. These vectors in combination with the chimeric light chain vector, pAG4611 (see also Q43845), were transfected into SP2/0 cells and clones were isolated. Antibody analysis using biosynthetically labelled proteins, immunoprecipitation and SDS-PAGE indicated appropriate bands for the heavy and light chains as well as the casembled antibody for the gamma-3 and gamma-4 chimeras. No detectable protein was isolated for the gamma-2 transfectants. 128.1 is an anti-
cused in a conjugate in which it is linked to a neuropharmaceutical or capinostic agent. The conjugate may be used to treat or prevent current control of the conjugate may be used to treat or prevent control of the conjugate may be used to treat or prevent control of the conjugate may be used to treat or prevent control of the conjugate may be used to treat or prevent control of the conjugate may be used to treat or prevent control of the conjugate may be used to treat or prevent control of the conjugate may be used to treat or prevent control of the conjugate may be used to treat or prevent control of the conjugate may be used to treat or prevent control of the control of the conjugate may be used to treat or prevent control of the co
